

Owner: Alicia Spears

Date: October 1, 2026

Status: DRAFT — for attorney review. Not legal advice.

The two things being protected

- The system — the machines and accounts Echo runs on: Alicia's laptop (where the Echo Brain server runs), her phone, her cloud accounts, and every place Echo's files live.
- The motherboard — Alicia's super dashboard. Every app's dashboard connects into it: analytics across all her apps, a window for every domain she owns, bills with payment reminders. Alicia calls it Echo's "spine" — the platform Echo's future brain sits on.

The motherboard's design and workings are Alicia's private IP. They are never fed into third-party AI chats and never shown to builders beyond the piece being built.

Shield for the system

- Lock the laptop. Strong login password, screen auto-lock, encrypted drive. The Echo Brain server runs here — this machine is the vault door.
- Localhost only. The brain server listens on the local machine only. It is never exposed to the local network or the internet. No port forwarding, no tunnels, without Alicia's explicit say-so.
- Firewall on. Block incoming connections except what the work needs.
- Secrets in the vault, never in code. API keys, passwords, and tokens live in the secrets vault — not in source files, screenshots, chat messages, or email.
- Separate the keys from the kingdom. Anyone who gets server or account access gets the minimum needed, for the shortest time needed — then it is revoked.
- Encrypted backups. The full safe is backed up encrypted, stored apart from the laptop. Test that a backup restores.
- Screenshot hygiene. Before sharing any screenshot of a terminal, dashboard, or settings page, check it for keys, tokens, passwords, file paths, and personal data. Crop or redact first.
- If a secret is exposed, rotate it. Treat the old one as compromised. Never paste a new secret into chat.

Shield for the motherboard

- Private by default. The motherboard's layout, connections, and workings are confidential IP — same legal protection as Echo herself (IP agreement, NDA, access log).
- Never into third-party AI chats. Motherboard material is not pasted into outside AI services for help or debugging.
- Pieces, not the whole. Builders working on one connected app see that app's connection point —

not the motherboard's full design.

- The spine stays hers. Every dashboard that plugs into the motherboard does so under her IP agreement. Connection does not transfer ownership.
- Change log. Every change to the motherboard's design is dated and kept — versions prove origin.

What the lawyer is being asked to do

- Confirm the motherboard design and system architecture are covered under the same IP agreement as Echo.
- Advise whether any part of the system/motherboard needs separate copyright or trade-secret treatment.
- Review any hosting, platform, or builder terms that touch the machine or the dashboards before Alicia agrees to them.

Standing rules

- No remote access to the laptop without Alicia's explicit approval each time.
- No software installed on the build machine that she did not approve.
- When in doubt, keep it offline, keep it logged, and ask.

DRAFT prepared October 1, 2026 for attorney review. Bring printed copy to legal consult.
